LEGAL OPERATIONS, UNDER FIRM CONTROL

A calmer operating system for litigation teams.

NyayaFlow brings matters, hearings, secure documents, staff access, privacy workflows, and accountable internal operations into one responsive workspace for Indian law firms.

Self-hosted PostgreSQL | Private document vault | English + Hindi OCR | Mandatory MFA | India-only deployment boundary

THE PRODUCT

One source of operational truth.

NyayaFlow is built around a simple principle: **firm data, human review, and clear provenance come first.** Court data is manual at launch; the platform labels source freshness honestly and preserves the context behind decisions.

01 · DAILY OPERATIONS

Matters & cause lists

Manage parties, status history, hearings, tasks, notes, assignees, and matter-level access. Detect same-advocate overlaps and travel-buffer conflicts without auto-reassignment.

02 · THE SMART VAULT

Documents that stay defensible

Upload private PDF, JPEG, PNG, and TIFF files into quarantine. Immutable versions, malware scanning, English/Hindi OCR, page confidence, corrections, search, and fresh download authorization stay linked.

03 · CONTROL & ACCOUNTABILITY

Access with a paper trail

Argon2id credentials, mandatory TOTP MFA, roles, restricted-matter grants, sessions, consent, retention, legal holds, and hash-chained audit events work together at the data layer.

04 · INTERNAL WORKSPACES

Prepare before you transact

Filing, contracts, client collaboration, billing, and analytics support internal preparation, review, approval, and manual records—without pretending to be connected to external systems.

The document lifecycle

01 · AUTHORIZE
Matter-aware, single-use upload intent.

02 · QUARANTINE
Checksum validation and private storage.

03 · PROCESS
Malware scan, page limit, OCR, safe retries.

04 · RETRIEVE
RLS-scoped search and audited downloads.

Manual source states: **manual · unverified · verified · stale**

PRODUCT LANDSCAPE

Progress with explicit boundaries.

Core firm workspace

- **Today, Matters & Vault**
  Daily workboard, matter lifecycle, manual hearings and deadlines, immutable documents, OCR, and tenant-scoped search.
- **Firm administration**
  Members, invitations, roles, grants, privacy requests, consent, retention rules, legal holds, and audit visibility.
- **Client portal**
  Time-bound, matter-specific access to approved milestones and selected documents; evidence uploads enter the same protected Vault pipeline.
- **Finance & analytics**
  Audited manual charges, approvals, advances, allocations, invoice drafts, reconciliation, and permission-safe operational reporting.

Controlled beta workspaces

- **Precedent research**
  Rights-gated authority records, citator evidence, and an accessible citation graph. PostgreSQL remains canonical; local Neo4j is optional.
- **BNS / BNSS / BSA matrix**
  Source-recorded provision comparisons and human review worksheets—not automated legal determinations.
- **E-filing suite**
  Hash-pinned bundle preparation, rule-pack checks, approvals, and local export manifests.
- **Contracts & CLM**
  Template snapshots, clause review, approvals, and manual execution tracking using Vault versions.

India-resident, self-operated architecture

WEB
Next.js application behind Nginx and TLS.

CANONICAL DATA
Self-hosted PostgreSQL with row-level security.

PRIVATE FILES
Non-public filesystem storage, served after fresh authorization.

WORKER
systemd process for ClamAV, OCR, durable jobs, and audit verification.

Designed-in safeguards

- Every tenant-owned record carries an organization boundary.
- Restricted matters need explicit access; revocation affects the next request.
- Audit records are hash-chained and described as tamper-evident.
- Backups are encrypted and restore drills are part of pilot readiness.

Intentionally not enabled

- No live court connector, scraping, or fabricated court status.
- No court submission, eSign/DSC, e-stamp, payment gateway, or GST filing.
- No client email delivery until an approved India-hosted provider exists.
- No privileged matter or Vault content is sent to OpenAI workflows.

Before pilot: reviewed retention, source-rights, accounting, privacy, and restore-drill evidence.
